Special features

Operation with external pilot air supply

- For vacuum applications
- For operating pressure of less than 3 bar
- For significant pressure fluctuations in the power section. Power section and pneumatic control section are isolated
- For heavily lubricated air in the power section
- For manifolds if the pressure zones are created via ducts 3 and 5 (not possible with 2x 3/2)
- For manifolds or pressure zones that are equipped with reversible 2x 3/2-way valves (valves on request)

Operation with internal pilot air supply

- For small pressure fluctuations in the power section
- For using pressure regulator plates in a vertical stacking construction, also in reverse operation
- As a low-cost solution

Reverse operation with compressed air supply via ducts 3 and 5

- Pressure zone separation via ducts 3 and 5
 - Example: duct 3 vacuum, duct 5 ejector pulse
 - Example: duct 3 high pressure for advancing the piston rod of a double-acting cylinder. Duct 5 low pressure for retracting the piston rod with low energy consumption
- 2x 3/2-way valves used as 5/4-way valve with controllable lap and pressure zone separation with the reversible variant

Reverse operation with a pressure regulator plate, compressed air supply via duct 1

- Reversible pressure regulator combined with a reversible 2x 3/2-way valve regulates outputs 2 and 4
 - AB regulator for each of outputs 2 and 4
 - A regulator for output 4
 - B regulator for output 2
- Reversible pressure regulators are in the control position immediately after the power supply is switched on
 - Adjustment possible at all times
 - Dynamic response characteristics
 - Reduced regulator load because the supply pressure is maintained when the valve is switched
 - Not exhausted via the regulator

Solenoid/pneumatic valves, ISO 15407-1

Key features

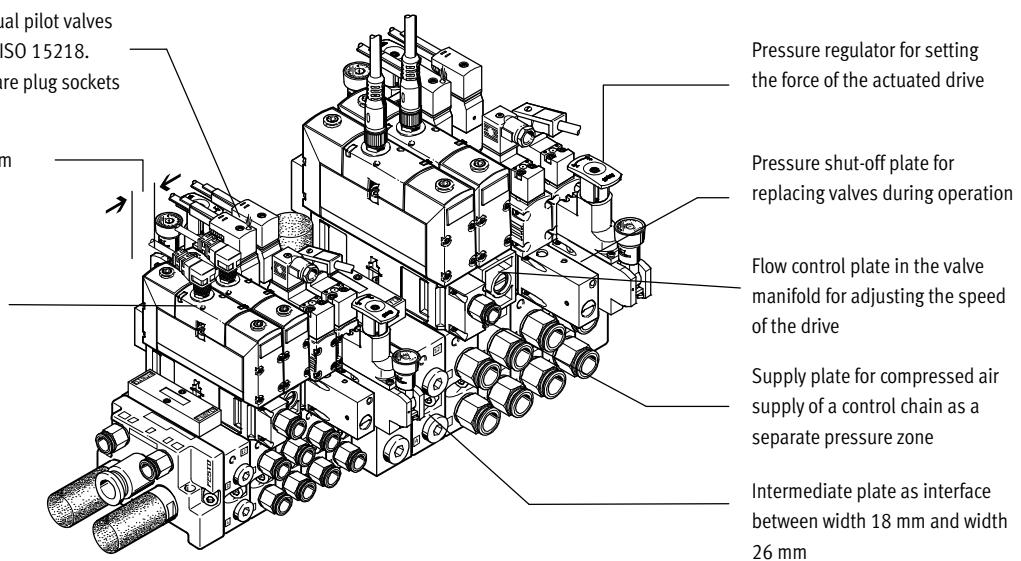

FESTO

Valve manifold VTIA with combination of sizes and vertical stacking

Solenoid valve with individual pilot valves and pneumatic interface to ISO 15218.
Can be connected with square plug sockets or round plugs

Widths of 18 mm and 26 mm can be combined

Solenoid valve with central round plug

Vertical stacking function

Pressure regulator valve

- Single variant to regulate the pressure at output 4(A) or 2(B) or at input 1(P)
- Dual variant to regulate the pressure at output 4(A) and 2(B) individually
- Reverse variant for the outputs so that the regulator is in the control position
- With pressure gauge connection

Flow control plate

- Designed with two flow control valves for adjusting the exhaust air flow rate at exhausts 5 or 3. This allows the drive to be set in motion and the desired speed to be set at the manifold using the manual override.

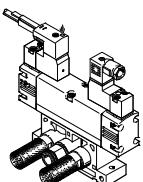

Vertical pressure shut-off plate

- Equipped with a switch via which the compressed air supply can be shut off. A directional control valve or subsequent vertical stacking plate can thus be replaced without switching off the overall air supply
- If the control chain has a redundant design, the cycle can continue even with cyclical control

Vertical supply plate

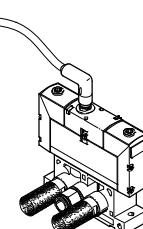

- As additional air supply for a valve
- To supply a third pressure zone

Individual connection with square plug, type C

The directional control valve has a pilot control to ISO 15218 and a plug pattern to EN 175301-803, type C.

Individual connection with central round plug

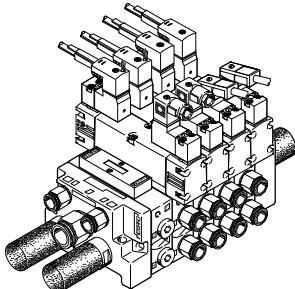

The electrical connection is established using a standardised M12- or M8 socket 24 V DC (EN 61076-2-101).

Conversion of pilot air exhaust

The valve manifold VTIA is supplied with unducted pilot air exhaust. By turning the seal between the valve

and manifold block, exhaust air (pilot air) can be diverted into pilot duct 12 and can thus be contained and silenced (see illustration).

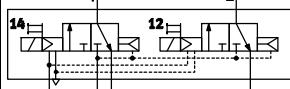

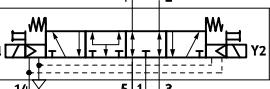

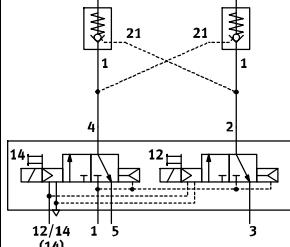

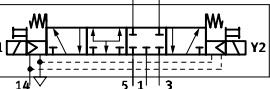

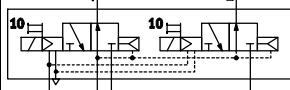

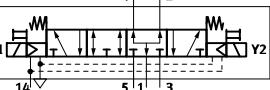

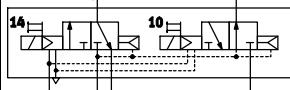

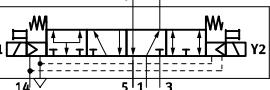

- [1] Ducted pilot air exhaust
- [2] Turning the seal by 180°
- [3] Unducted pilot air exhaust (as supplied)

ISO valves with switching position sensing for safety-related pneumatic components

The 5/2-way single solenoid valve with spring return contains an inductive sensor that monitors the normal position of the piston spool valve. This valve is not a safety device in accordance with the Machinery Directive 2006/42/EC.

For use in higher categories, the sensor signal from the valve must be evaluated by a control unit. This valve is suitable for use in safety-related parts of control systems to EN ISO 13849-1. This valve is designed for installation in machines

and automation systems and must only be used in industrial applications (high-demand mode). The circuit symbol represents a valve with a proximity sensor with switching output signal with a normally open contact. In accordance with

ISO 1219-1, this symbol is used both for normally open contacts and for normally closed contacts. The switching element function of the sensors used here is designed as an N/C contact.
